

Applied Risk OT Solution Snapshot

Our OT Penetration Testing services follow a proven methodology, tailored to Operations Technology (OT), automation and other real-time systems. This results in a comprehensive assessment enabling you to mitigate risks and remediate potential system vulnerabilities.

As OT becomes more interconnected, the exposure to network-based cyber incidents increases, putting your production, safety—and your reputation—at risk. To mitigate that risk, Applied Risk provides the expertise needed to help you understand your system's current weaknesses, identify and prioritize areas of improvement and align your practices to established industry standards and regulations.

Our team of security experts will evaluate the security of your OT environments to identify vulnerabilities and other issues which could be exploited by threat actors to impact the availability and integrity of your operational technology environment.

Assessments are tailored to the needs of each client, and can include: internal penetration testing, external penetration testing, embedded device Assessment, application penetration testing, physical penetration testing and wireless assessments.

Key Benefits

- Understand types of attacks which may be targeted at your OT assets
- An in-depth exploration and analysis of your industrial assets
- Identify and prioritise risks that may impact critical and production systems

Deliverables

Applied Risk will provide a detailed technical report including:

- An overview of the findings at an executive level
- A detailed technical analysis and remediation recommendations for vulnerabilities
- Security vulnerabilities classified according to potential impact and likelihood of exploitation
